VM Fusion

How to run Windows on a Mac (without losing Mac tools)

Available from **https://goo.gl/mUvAvZ** the maker.

The price has gone up from $75 to $160. Personally, I think it is worth the price. When I used it some years ago, a major advantages to this software was (is) that both OS X and Windows were active at the same time. All your familiar tools were still available while Windows still ran as an application.

Browsers I Use

1. Google Chrome is my first choice
2. Firefox is second and reliable
3. Tor is for special purposes where I want to conceal my address

Browsers I Avoid

1. Microsoft internet explorer
2. Safari (comes Mac OS)

Choices are really about your personal needs and what is comfortable for you/me.

Browser vs. Search Engine

A browser is a program which runs on your computer. It enables you to connect to the internt.

A search engine is a program that runs on a different computer and is part of the internet. You connect your browser to a search engine to look for information stored on the internet.
